

FOCUSED STUDY ACTIVITY WORK PLAN

General Information

Work Plan Unique Identifier:	W-MD-1-1718
Focused Study Activity Title:	Develop an Accredited Standard Method for Quantitative Analysis of Naphthenic Acids Concentrations
Focused Study Category:	Monitoring Design and Method Improvement
Geographic Location (<i>choose from drop-down menu. If Project Location is in more than one area choose from second drop-down</i>)	Athabasca Oil Sands Region
Monitoring Site(s) Coordinates (<i>latitude and longitude</i>)	
Project Leader:	Richard Strub
Organization and contact information:	Environment and Climate Change Canada Water Science and Technology Directorate Richard.Strub@canada.ca
Date Study initiated:	
Monitoring Category: (<i>From OSM long-term plan; choose from drop-down menu</i>)	Watershed Monitoring
Strategic Objective of Focused Study: (<i>From OSM long-term plan; choose from drop-down menu</i>)	Objective S1: Evaluate and update Standard Operating Procedures
Hypotheses: (<i>Briefly outline the specific hypotheses that your focused study is aiming to address</i>)	<ol style="list-style-type: none"> <i>The Source Identification methodologies being employed are capable of differentiating complex mixtures in industrial process waters from natural bitumen sources.</i> <i>Effects-Directed Analysis (EDA) allows for better characterization of both industrial and natural bitumen sources. Biological responses to generated chemically-distinct fractions from these sources will further enable the prioritization of chemical classes of interest.</i>
Deliverables: <i>What tangible goal (s) and/or</i>	This project will produce two deliverables: <ul style="list-style-type: none"> • Certified Standard Reference Materials for analyzing water

<p>product(s) will the monitoring produce and when?</p>	<p>soluble bitumen organics, including NA/AEOs.</p> <ul style="list-style-type: none"> Synthesis of a Primary Naphthenic Standard as required for CALA Accredited analytical methods for NAs. <p>These deliverables follow the recommendations made by experts at the Naphthenic Acid Methodology Workshop held in Edmonton on March 14th, 2016.</p>
---	---

Detailed Study Plan

(Please provide detailed information on the specifics of your focused study including – (keywords, hypothesis and the assumptions and constraints behind your hypothesis)

Provide a maximum of 10 key words that describe this project. Use commas to separate them:

analytical methodology, tailings pond seepage, source identification, groundwater, bitumen soluble organics, toxicological significance, certified reference materials, effects directed analysis

Describe how you will test your hypothesis:

We will build on our previous studies and address the following key recommendation from our March 2016 Edmonton Workshop on “**Analytical Methods for Monitoring Ambient Waters Potentially Influence by Bitumen in the Athabasca Region**”:

- “To validate and refine analytical methodologies that allow for the discrimination of industrially-derived chemicals from those that arise from naturally-occurring bitumen deposits in groundwater and surface wa It was agreed that at present the definition of NAs would be a simple carboxylic acid with two oxygen atoms and the R group can be multi-cyclic and aromatic but does not include heteroatoms (no C or H) or any other functionalities:

- Bitumen-relevant reference materials for method development and toxicity tests were highlighted as a key gap to be addressed in order to support monitoring and research into this family of chemicals. Since

most analytical instrumentation is comparative, it requires a sample of known composition (reference material) for accurate calibration. These reference materials are produced under stringent manufacturing procedures and differ from laboratory reagents in their certification and the traceability of the data provided.

The deliverables for 2017-2018 include the following:

- Bitumen Relevant Standard Reference Materials for water soluble organic chemicals, including NA and other organic substances. Materials to be used in NA Analytical Methodology Development, Toxicity Testing and Effect-Directed Analyses by multiple stakeholders. A representative sample has been sent to the Burlington laboratory from COSIA of bulk tailings water in order to prepare a concentrated NA standard reference sample for analytical method development and toxicity testing. The tailings water sample will be processed by ECCC to generate concentrated extracts of water soluble organics. The extraction process is based on a method developed by ECCC and validated against OSPW and bitumen-influenced groundwater (Bauer et al. 2016 in preparation). ECCC has been certified by American Association for Laboratory Accreditation (A2LA) to be a developer of reference materials. The resulting samples will be characterized by ECCC and other parties using the approved analytical methods and SOPs. The reference materials will be characterized, certified and available nationally by the appropriate supplier of reference materials. The reference materials will benefit the NPRI and international oil spill research efforts.
- Synthesis of a mono-aromatic NA primary standard prevalent in OSPW and natural bitumen-influenced groundwater; the structure of which has been proposed by academic and ECCC researchers as representative of 1 class of water soluble NA acids. This traceable, authentic and relevant standard will also be isotopically labelled to assist laboratories involved in analysis of Naphthenic acids as part of the delivery of a robust quality assured analytical operational method for NAs. This work has been started in 2016-17 and will be completed in 2017-18.
- Continued work on preparation of the three certified reference materials (RMs) in this focused study (OSPW, groundwater and surface water) will continue in year 2017-18 with completion in mid-year 2018-19. These RMs are relevant sources of bitumen-derived organics to the Athabasca watershed (surface water, groundwater and process water). Future work is proposed to develop reference material for groundwater- and surface water-derived bitumen organics.

Assumptions and Constraints behind the hypothesis and the testing method:

Assumptions

A synthetic primary standard will be an adequate first proxy to begin to quantify the range of molecular structures associated with bitumen-related Naphthenic Acids.

Oil sands process water, and future planned samples of groundwater and surface water are sufficiently representative of the range of variation in these waters that they can be used to define an appropriate and

certifiable reference material.

Constraints

Scope: There are constraints and risks inherent in undertaking custom synthesis of unknowns. The structure proposed is that of Prof. Steve Rowland based on work with ECCC. Prof. Rowland has led the identification work on new compound classes within the NA umbrella and is the global lead authority in this area. A comprehensive review of the available data behind Professor Rowland's proposed structure was conducted by the private synthetic laboratory which has costed the synthesis and would conduct the work (Sneickus Innovations) and a jointly agreed-upon structure with Professor Rowland was finalized based on new data.

It is important to note that the proposed compound is detected in both OSPW and groundwater influenced by bitumen, as 1 of 8 isomers of a family of mono-aromatic acids. All members of this family are enriched substantially in OSPW, with strong potential for use as a tracer for OSPW migrations (Hewitt et al. 2016, in prep).

It is also important to note that should the proposed structure ultimately prove to not be one of the 8 isomers present in bitumen influenced waters, several positive outcomes will nevertheless be realized:

The synthetic route will generate a mixture of isomers, in addition to the one targeted. It is possible one of these isomers will be present in bitumen and this will thus fulfill the original intent.

The targeted compound (and associated isomers also generated) will all be close structural analogs to what actually is present. As such, they will be better than anything that is commercially available at present and can still be used for analytical method development with continued financial support and ability to secure and maintain human resources (dedicated term EG-03), and laboratory consumables including extraction resins, is essential.

Data Management

If this work generates data please summarize your project-level data management plan.

Deliverables	Timeframe
Data Collection Period: <i>Field work</i>	Start : 2017-05-01 End: 2017-10-31
Data Analysis Period: <i>Laboratory analysis and QA/QC of data</i>	Start : 2017-04-01 End: 2018-03-31
Data Release Date: <i>Metadata and data consistent, complete and meet basic standard format for publication in Open Data; on or linked to JOSM portal</i>	2018-03-31

Reporting and Publications

Provide information on the anticipated reports / publications. (Insert additional rows if needed)

Expected Subject/Titles of Publications or Reports	Short Description of Publication or Report	Expected Year of Publication

Technical / Professional Roles and Responsibilities

Identify members of the monitoring team/organization, their roles and responsibilities. Identify monitoring organization leads if different from overall monitoring activity lead. (Insert additional rows if needed)

Role	Responsibilities
Project Lead (ECCC)	Project Design, Scientific Oversight and Management
Project Co-Lead	Advice on instrument SOPs, Standard Reference Materials preparation. Link to the Water Methodology Project (W2-1-1)
Program Scientist (ECCC)	Study design document preparation
Project Support (ECCC)	Data processing and administrative support
Project Support (ECCC)	Reference sample preparation, methods testing and validation, and sample characterization
Project Support (AEP)	AEP representation to assist in Scientific Oversight and AEP needs from this focused project

Deliverables (Year 1) If your Focus Study is longer than 1 year then complete **Appendix 3** for multi-year deliverables breakdown

Provide a summary of tangible quarterly deliverables. Identify major project areas (deliverables) and results that can be identified as a tangible goal. This could include: field work, lab work/ analysis, evaluation, data, reports, publications, SOPs etc. Do not define process as your Deliverable e.g. 'fly to Ft. McMurray to conduct fieldwork' or 'seek Director approval for report'.

Deliverable(s) (please provide enough information to support status reporting)
Q1 – April to June
<p>Coordinate sample collection list of required source waters (OSPW, ground/surface waters) to be collected by COSIA.</p> <p>Continue characterizations of OSPW samples collected in 2016/17.</p>
Q2 – July to September
<p>Oversee collection and sub-sampling of required source waters being collected by COSIA in 2017/18 for the development of CRMs</p> <p>Commence characterizations of bitumen-influenced samples collected for CRMs in 2017/18 (OSPW, ground/surface waters)</p>
Q3 – October to December
<p>Continue oversight of collection and sub-sampling of required source waters being collected by COSIA for the development of CRMs</p> <p>Continue characterizations of bitumen-influenced samples collected in 2017/18 (OSPW, ground/surface waters).</p>
Q4 – January to March
<p>Complete sub-sampling of required source waters being collected by COSIA for the development of CRMs.</p> <p>Continue characterizations of bitumen-influenced samples collected in 2017/18 (OSPW, ground/surface</p>

waters).

Detailed Financial Breakdown – Year 1 of 3 (2017-2020)

Also complete **Appendix B** for the multi-year financial breakdown

Budget requirements – List areas that require budget expenditures: (ADD OR DELETE BUDGET CATEGORIES AS REQUIRED)	OS Funding	External Funding (outside JOSM)
O&M - Operations and Maintenance:		
Helicopter Costs	\$	\$
Field Costs	\$	\$
Data Management	\$	\$
Internal Lab Analysis	\$21,000	\$
Consumable Materials & Supplies	\$142,361	\$
Sub-Total	\$	\$
O&M - Travel		
Field Work	\$	\$
Conferences	\$	\$
Meeting (annual planning meeting in Burlington for 1 person on travel status)	\$1,500	\$
Sub-Total	\$	\$
O&M - External Contracts :		
Goods and Services Contract <i>Primary standard continued contract</i>	\$50,667	\$
External Lab Analysis	\$	\$
Sub-Total	\$	\$
Salaries:		
Principal Investigator	\$	\$
Technical / Professional Assistants (2-1 year term EG-03, 1 CH-02 operations management), Lab FTEs	\$110,042	\$
Field Staff	\$	\$
Sub-Total	\$110,042	\$
2017-2018 GRAND TOTAL* (Before other related	\$325,570	\$

Budget requirements – List areas that require budget expenditures: (ADD OR DELETE BUDGET CATEGORIES AS REQUIRED)	OS Funding	External Funding <i>(outside JOSM)</i>
Costs)		

*The Total Salary Costs for ECCC (\$110,042) in 2017-18 with other related costs is \$151,330. The total O&M costs for ECCC (\$215,528) with other related costs is \$238,670. **The Grand total costs for ECCC (\$325,570) with other related costs is \$390,000.**
